SQL Basics for AI - Subjective

Problem Statement

You are a data analyst at a tech company. The HR department needs insights about employee data. You have access to an **employees** table with the following structure:

Table: employees

Column	Data Type	Description
employee_id	INTEGER	Unique identifier (Primary Key)
name	TEXT	Employee name
department	TEXT	Department name
salary	INTEGER	Annual salary
hire_date	DATE	Date of joining

The table contains 100 employee records across departments: Engineering, Sales, Marketing, Finance, HR, and Operations.

Task 1: Basic Querying

Write SQL queries to answer the following:

1. Select all columns for employees in the **Marketing** department
2. Display only `name`, `department`, and `salary` for employees earning more than $90,000
3. Find employees in either **Sales OR Finance** departments

Task 2: Sorting and Limiting

Write SQL queries to find:

1. The **top 5 highest-paid employees** (sort by salary descending, limit to 5)
2. The **3 most recently hired employees** in Engineering department (sort by hire_date descending)
3. The **oldest employee** (by hire_date) who earns more than $70,000 and is NOT in HR department

---

Task 3: Calculated Fields and Aliases

Write SQL queries to:

SQL Basics for AI - Subjective

1. Calculate monthly salary for all employees:
    - Display `name`, `salary`, and `salary/12` aliased as `monthly_pay`
    - Only show employees earning more than $60,000
2. Create a report for the Finance department showing:
    - `name` aliased as `employee_name`
    - `salary` aliased as `annual_salary`
    - `salary/12` aliased as `monthly_salary`
    - Sort by salary descending

Submission Guidelines

- All SQL queries written clearly
- Brief explanation of what each query does
- Text output showing sample results (you can use online SQL editors like sqliteonline.com to test)
